

The Niles Roofing Division focuses on restoring existing roofs: BUR, EPDM, PVC, TPO, METAL and MOD BIT Secondary Containments.

The system used for this spray application is an 80mill system that involves zero tear off of old materials and no disruption to the facility. There is no VOC or abrasive material with the product used. It is an instaset spray that is 80% cured when it hits the roof. It can be installed with slip resistant granules, which keeps it UV stable. It can be applied with a white elastomeric coating and can cool the inside of a facility by 10 degrees in the summer and by 20 degrees on the roof. Better yet is the ability to waterproof everything, which includes the walls, mechanical, HVAC, and windows.

In 2019, the Niles' Crews installed over 2.5 million square feet.
